Product owners, software developers, and Scrum Master are set and ideally don't change over time; the critical part is the Release Manager role you need to define here							

Goals	Create a flawless and valuable project that the industry partner will be able to use. Create clean and reusable code and structures
Meeting norms	- be on time -cams on -reach out if you are not gonna make it - We'll respect each other's opinions and try to communicate as much as possible
Working norms	- Document and comment your code - We'll use branches in a sensefull way and not work directly on the main branch - Transparency - Clear commit messages - We test our code - We write clean code
Coordination norms	- We'll update the feature board in time - If there are multiple devs working on one item, they will communicate and coordinate and not work independently - We balance the workload among the team
Communication norms	- We talk about issues and problems when we face them - Transparent communication - Daily check the corresponding channels
Consideration norms	- We support each other when ever needed - We talk about issues openly - If we can't reach a consensus, we'll vote - We don't take critique personally
Cont. improvement norms	- We'll be open to learn and teach - We encourage critique and improvements efforts
Rewards	- We celebrate milestones with pizza - Very helpful team members get an extra slice of pizza
Sanctions	- Sit ups (at least 10, more if needed)
Signatures	
Scrum Master	Rene Jokiel
Product owner	Christoph Huy
Product owner	Carl Mosler
Software developer	Endri Shameti
Software developer	Dhruvin Vekariya
Software developer	Abdul Moez
Software developer	Vineesh Koppay
Software developer	Asad Raza
Software developer	Qiblatain Fatima
Software developer	Shikhar Thakur

Product Vision	Project Mission
Product Vision: TaskOrbit provides a domain-independent framework for building reliable conversational AI agents through declarative workflows and structured agent orchestration. The platform enables organizations to create configurable voice and chat agents that integrate STT, LLMs, TTS, and external APIs into unified conversational workflows. By standardizing conversational automation across different business domains, TaskOrbit helps companies reduce manual effort, streamline internal and external processes, and deploy scalable AI-driven assistants without building custom infrastructure from scratch.	The mission of this project is to create an MVP for a Voice AI Agent platform. Within the given project time-frame, the team is committed to delivering a fully functional conversational interface supporting configurable single-agent and multi-agent workflows. Core functionality will include the integration of STT for user input, a LLM backend for conversational processing and reasoning, agent orchestration capabilities, and TTS for audio output. The primary objective of this project is to provide a reliable and extensible end-to-end conversational system through the integration of these core components.

Term	Definition
E2E	End-to-End (Workflow): The complete processing pipeline of a system interaction, starting from user input through internal processing and concluding with the system's resulting output.
LLM (Large Language Model)	The underlying AI backend used for conversational processing, reasoning, and generating text responses based on user prompts
TTS (Text to Speech)	The technology that converts text into a spoken audio output (e.g. the voice of the agent talking to the user)
STT (Speech to Text)	The technology that converts spoken audio input into a text (e.g., transcribing the spoken input from a user for a LLM)
Latency	The time delay between the end of a user's spoken input and the beginning of the agent's audio response (Roundtrip Time)
Agent	An autonomous entity within the platform configured with a specific persona, logic and context to interact with the user via voice (or text)
Agent Orchestration	The capability of the TaskOrbit framework to coordinate multiple specialized conversational agents within a single workflow to solve tasks
Agent Persona	The behavioral guidelines assigned to an agent to ensure it interacts appropriately with the user based on its specific task
Agent Hand-off	The seamless transfer of the conversation from one specialized agent to another when the user's request shifts to a different topic
External Tool	An external integration, API or function invoked by the agent to interact with outside services, databases or systems
Internal Tool	An internal capability, native logic or workflow executed within the agent's system to process information or manage tasks
Conversation	A continuous spoken or written dialogue interaction between a user and an agent, focused on achieving specific tasks
User Interruption	The event where a user starts speaking while agent is actively outputting audio, signaling to stop talking and listen to the new input
Inference Server	The dedicated cloud infrastructure hosting self-hosted, open-source LLMs for TaskOrbit to ensure independent processing
Workflow Engine	The core backend component that manages the state, routing, and execution sequence of complex, multi-step tasks across different agents
Benchmark	A test execution focused primarily on measuring E2E latency across different system configurations to identify the fastest processing variants
Guardrails	Safety and policy constraints implemented within the agent workflow to control and filter LLM outputs, ensuring responses stay within scope
Prerequisite Step	A mandatory preceding agent or task that must be executed or completed before the current agent can be activated
Allowed Handoff	A predefined, permitted path that specifies which other specialized agents the current agent is authorized to transfer the conversation to
Conditional Prerequisite	A dynamic workflow rule where preceding agents are determined on-the-fly based on the routed intent of the user -> overriding static steps

#	Feature Definition of Done	Sprint Release Definition of Done	Project Release Definition of Done
	General coding standards are met (eg. Formatting, Comments, Logging, no API-Keys in Repo)		
	Every PR is peer-reviewed by at least one other developer		
	Documentation is updated (eg. System Architecture, SBOM)		
	Unit tests for new features have been written		
		A release candidate representing a functional and verifiable increment over the previous sprint is tagged	
		Existing features must remain operational and unaffected by the new changes	
		Sprint release changelog have been written	
			The system can be built and started from a clean repository checkout
			Core workflows are fully integrated and demonstrable end-to-end
			All major components are integrated and operational
			No critical or blocker defects remain open
			Architecture and technical documentation are finalized and updated
			SBOM and required project documentation are completed
			CI/CD pipeline passes successfully for the release version
			Release version is tagged and reproducible
			Build and deployment instructions are documented and verified
			Source code, documentation, and deliverables are submitted

How to play planning poker							
1. Everyone type their number into their value field, don't hit return yet							
2. Someone, perhaps a product owner, count down 3.. 2.. 1..							
3. Then, everyone hit return to submit their value
