| Product owners, software developers, and Scrum Master are set and ideally don't change over time; the critical part is the Release Manager role you need to define here |             |               |           |                    |                 |              |               |
|                                                                                                                                                                         |             |               |           |                    |                 |              |               |

|                                |                                                                                                                                                                                                     |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Goals</b>                   | Create a flawless and valuable project that the industry partner will be able to use. Create clean and reusable code and structures                                                                 |
| <b>Meeting norms</b>           | - be on time -cams on -reach out if you are not gonna make it                                                                                                                                       |
|                                | - We'll respect each other's opinions and try to communicate as much as possible                                                                                                                    |
| <b>Working norms</b>           | - Document and comment your code - We'll use branches in a sensefull way and not work directly on the main branch - Transparency - Clear commit messages - We test our code - We write clean code   |
| <b>Coordination norms</b>      | - We'll update the feature board in time - If there are multiple devs working on one item, they will communicate and coordinate and not work independently - We balance the workload among the team |
| <b>Communication norms</b>     | - We talk about issues and problems when we face them - Transparent communication - Daily check the corresponding channels                                                                          |
| <b>Consideration norms</b>     | - We support each other when ever needed - We talk about issues openly - If we can't reach a consensus, we'll vote - We don't take critique personally                                              |
| <b>Cont. improvement norms</b> | - We'll be open to learn and teach - We encourage critique and improvements efforts                                                                                                                 |
| <b>Rewards</b>                 | - We celebrate milestones with pizza - Very helpful team members get an extra slice of pizza                                                                                                        |
| <b>Sanctions</b>               | - Sit ups (at least 10, more if needed)                                                                                                                                                             |
| <b>Signatures</b>              |                                                                                                                                                                                                     |
| Scrum Master                   | Rene Jokiel                                                                                                                                                                                         |

| <p>Product Vision: TaskOrbit provides a domain-independent framework for building reliable conversational AI agents through declarative workflows and structured agent orchestration. The platform enables organizations to create configurable voice and chat agents that integrate STT, LLMs, TTS, and external APIs into unified conversational workflows.</p> <p>By standardizing conversational automation across different business domains, TaskOrbit helps companies reduce manual effort, streamline internal and external processes, and deploy scalable AI-driven assistants without building custom infrastructure from scratch.</p> | <p>The mission of this project is to create an MVP for a Voice AI Agent platform. Within the given project time-frame, the team is committed to delivering a fully functional conversational interface supporting configurable single-agent and multi-agent workflows.</p> <p>Core functionality will include the integration of STT for user input, a LLM backend for conversational processing and reasoning, agent orchestration capabilities, and TTS for audio output. The primary objective of this project is to provide a reliable and extensible end-to-end conversational system through the integration of these core components.</p> |

| Term                       | Definition                                                                                                                                                                               |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| E2E                        | End-to-End (Workflow): The complete processing pipeline of a system interaction, starting from user input through internal processing and concluding with the system's resulting output. |
| LLM (Large Language Model) | The underlying AI backend used for conversational processing, reasoning, and generating text responses based on user prompts                                                             |
| TTS (Text to Speech)       | The technology that converts text into a spoken audio output (e.g. the voice of the agent talking to the user)                                                                           |
| STT (Speech to Text)       | The technology that converts spoken audio input into a text (e.g., transcribing the spoken input from a user for a LLM)                                                                  |
| Latency                    | The time delay between the end of a user's spoken input and the beginning of the agent's audio response (Roundtrip Time)                                                                 |
| Agent                      | An autonomous entity within the platform configured with a specific persona, logic and context to interact with the user via voice (or text)                                             |
| Agent Orchestration        | The capability of the TaskOrbit framework to coordinate multiple specialized conversational agents within a single workflow to solve tasks                                               |
| Tool                       | An external integration, API or function invoked by the agent to interact with outside services, databases or systems                                                                    |
| Skill                      | An internal capability, native logic or workflow executed within the agent's system to process information or manage tasks                                                               |
|                            |                                                                                                                                                                                          |
|                            |                                                                                                                                                                                          |
